

Armtrac Strimmer

The Armtrac Strimmer is designed as an aid in ground UXO clearance, specifically for difficult to reach areas where none of Armtrac's other machines are able to reach. As with all Armtrac products, the **Armtrac Strimmer** is armoured to withstand Anti-tank mines.

The Strimmers single flail header can operate horizontally with an effective 2 meter diameter clearance area, or it can be tilted vertically to apply a direct impact on any difficult or suspicious objects. In the vertical plain the Strimmers 3000RPM flail has an impact force of 80 Tonnes/ square inch, totally destroying anything in its path.

The Armtrac Strimmer uses the same industry standard fittings allowing it to be attached to any variety of appropriate machines including the **Armtrac 75T-230 and Armtrac 400**. The Strimmer uses the hydraulic connections from the host vehicle, therefore no additional power pack is necessary.

It is most suited for fitment to a long reach excavator, to enable it to reach into difficult areas and slope angles. The digger blade doubles as a protection shield from the flail and debris, as well as to claw and dig rocks and moving banks for the machine to move freely and safely between areas.
